

Features

- **40mW (3.3V Input) High Side MOSFET**
- **Current-Limit and Short Circuit Protections**
- **Over-Temperature Protection**
- **Under-Voltage Lockout Protection**
- **Reverse Current Blocking when Disabled**
- **Deglitched Fault Indication Output**
- **Internal Soft-Start Control**
- **Output Discharge when Disabled**
- **Logic Level Enable Input**
- **UL Approved-File No. E328191**
- **UL-CB Scheme IEC/EN62368-1 Certified**
- **TUV IEC/EN62368-1 Certified**
- **Lead Free and Green Devices Available (RoHS Compliant)**

General Description

The APL3516A/B/C/D series are 40mΩ (3.3V input) high side load switches with an EN logic input and an OCB fault indication output.

The protection features include current-limit protection, short circuit protection, and over-temperature protection. The device limits the output current at current-limit threshold level. When V_{OUT} drops below 1.5V, the devices limit the current to a lower and safe level. The OTP limits the junction temperature below 140°C in case of short circuit or over load conditions.

Pin Configuration

Applications

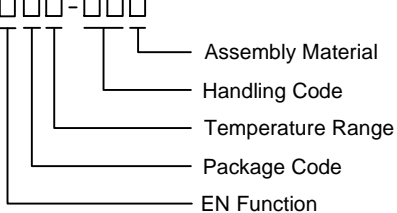

- **Display Ports**
- **Notebook and Desktop Computers**
- **High-Side Power Protection Switches**
- **Short-Circuit Protections**
- **Heavy Capacitive Loads Protections**

Simplified Application Circuit

ANPEC reserves the right to make changes to improve reliability or manufacturability without notice, and advise customers to obtain the latest version of relevant information to verify before placing orders.

Note : ANPEC lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS. ANPEC lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J-STD-020D for MSL classification at lead-free peak reflow temperature. ANPEC defines "Green" to mean lead-free (RoHS compliant) and halogen free (Br or Cl does not exceed 900ppm by weight in homogeneous material and total of Br and Cl does not exceed 1500ppm by weight).

Absolute Maximum Ratings (Note 1)

Symbol	Parameter	Rating	Unit
V_{IN}	VIN to GND Voltage	-0.3 ~ 4	V
V_{OUT}	VOUT to GND Voltage	-0.3 ~ 4	V
V_{ENB}, V_{EN}	EN, ENB to GND Voltage	-0.3 ~ 4	V
V_{OCB}	OCB to GND Voltage	-0.3 ~ 4	V
T_J	Maximum Junction Temperature	-40 ~ 150	°C
T_{STG}	Storage Temperature	-65 ~ 150	°C
T_{SDR}	Maximum Lead Soldering Temperature, 10 Seconds	260	°C

Note 1 : Absolute Maximum Ratings are those values beyond which the life of a device may be impaired. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Thermal Characteristics

Symbol	Parameter	Typical Value	Unit
θ_{JA}	Junction-to-Ambient Resistance in Free Air ^(Note 2) SOP-8	160	°C/W

Note 2 : θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air.

Recommended Operating Conditions

Symbol	Parameter	Range	Unit
V_{IN}	VIN Input Voltage	2.9 ~ 3.7	V
I_{OUT}	OUT Output Current	0 ~ 0.9	A
T_A	Ambient Temperature	-40 ~ 85	°C
T_J	Junction Temperature	-40 ~ 125	°C

Electrical Characteristics

Unless otherwise specified, these specifications apply over $V_{IN}=3.3V$, $V_{EN}=3.3V$ or $V_{ENB}=0V$ and $T_A=-40 \sim 85$ °C. Typical values are at $T_A=25$ °C.

Pin Description

PIN		FUNCTION
NO.	NAME	
1	GND	Ground.
2, 3	VIN	Power Supply Input. Connect this pin to external DC supply.
4	EN (APL3516A/C)	Enable Input. Pull this pin to high to enable the device and pull this pin to low to disable device. The EN pin cannot be left floating.
	ENB (APL3516B/D)	Enable Input. Pull this pin to high to disable the device and pull this pin to low to enable device. The ENB pin cannot be left floating.
5	OCB	Fault Indication Pin. This pin goes low when a current limit or an over-temperature condition is detected after a 8ms deglitch time.
6, 7, 8	VOUT	Output Voltage Pin. The output voltage follows the input voltage. When ENB is high or EN is low, the output voltage is discharged by an internal resistor.

Block Diagram

Typical Application Circuit

Function Description

VIN Under-Voltage Lockout (UVLO)

The APL3516A/B/C/D series of power switches are built-in an under-voltage lockout circuit to keep the output shutting off until internal circuitry is operating properly. The UVLO circuit has hysteresis and a de-glitch feature so that it will typically ignore undershoot transients on the input. When input voltage exceeds the UVLO threshold, the output voltage starts a soft-start to reduce the inrush current.

Power Switch

The power switch is an N-channel MOSFET with a low $R_{DS(ON)}$. The internal power MOSFET does not have the body diode. When IC is off, the MOSFET prevents a current flowing from the VOUT back to VIN and VIN to VOUT.

Current-Limit Protection

The APL3516A/B/C/D series of power switches provide the current-limit protection function. During current-limit, the devices limit output current at current limit threshold. For reliable operation, the device should not be operated in current limit for extended period.

Short-Circuit Protection

When the output voltage drops below 1.5V, which is caused by the over load or short circuit, the devices limit the output current down to a safe level. The short circuit current limit is used to reduce the power dissipation during short circuit condition. If the junction temperature is over the thermal shutdown temperature, the device will enter the thermal shutdown.

OCB Output

The APL3516A/B/C/D series of power switches provide an open-drain output to indicate that a fault has occurred. When any of current-limit or over-temperature protection occurs for a deglitch time of $t_{D(OCB)}$, the OCB goes low. Since the OCB pin is an open-drain output, connecting a resistor to a pull high voltage is necessary.

Enable/Disable

Pull the ENB above 2V or EN below 0.8V to disable the device, and pull ENB pin below 0.8V or EN above 2V to enable the device. When the IC is disabled, the supply current is reduced to less than 1 μ A. The enable input is compatible with both TTL and CMOS logic levels. The EN/ENB pins cannot be left floating.

Over-Temperature Protection

When the junction temperature exceeds 140°C, the internal thermal sense circuit turns off the power FET and allows the device to cool down. When the device's junction temperature cools by 20°C, the internal thermal sense circuit will enable the device, resulting in a pulsed output during continuous thermal protection. Thermal protection is designed to protect the IC in the event of over temperature conditions. For normal operation, the junction temperature cannot exceed $T_{j,+125^{\circ}\text{C}}$.

Application Information

Input Capacitor

A 1 μ F or higher ceramic bypass capacitor from VIN to GND, located near the APL3516, is strongly recommended to suppress the ringing during short circuit fault event.

When the load current trips the SCP threshold in an over load condition such as a short circuit, hot plug-in or heavy load transient the IC immediately turns off the internal power switch that will cause VIN ringing due to the inductance between power source and VIN. Without the bypass capacitor, the output short may cause sufficient ringing on the input to damage internal control circuitry.

Input capacitor is especially important to prevent V_{IN} from ringing too high in some applications where the inductance between power source to VIN is large (ex, an extra bead is added between power source line to VIN for EMI reduction), additional input capacitance may be needed on the input to reduce voltage overshoot from exceeding the absolute maximum voltage of the device during over load conditions.

Output Capacitor

A low-ESR 150 μ F aluminum electrolytic or tantalum between VOUT and GND is strongly recommended to reduce the voltage droop during hot-attachment of downstream peripheral. Higher-value output capacitor is better when the output load is heavy. Additionally, bypassing the output with a 0.1 μ F ceramic capacitor improves the immunity of the device to short-circuit transients.

Layout Consideration

The PCB layout should be carefully performed to maximize thermal dissipation and to minimize voltage drop, droop and EMI. The following guidelines must be considered:

1. Please place the input capacitors near the VIN pin as close as possible.
2. Output decoupling capacitors for load must be placed near the load as close as possible for decoupling high-frequency ripples.
3. Locate APL3516 and output capacitors near the load to reduce parasitic resistance and inductance for excellent load transient performance.

4. The negative pins of the input and output capacitors and the GND pin must be connected to the ground plane of the load.
5. Keep V_{IN} and V_{OUT} traces as wide and short as possible.
