### DESCRIPTION

This RS244 is an octal non-inverting buffer/driver with 3-state outputs. The 3-state outputs are controlled by the output enable inputs  $1\overline{OE}$  and  $2\overline{OE}$ . A HIGH on  $\overline{OE}$  causes the outputs to assume a high impedance OFF-state. V<sub>CC</sub> supporting operating voltage from 1.65 V to 5.5 V.

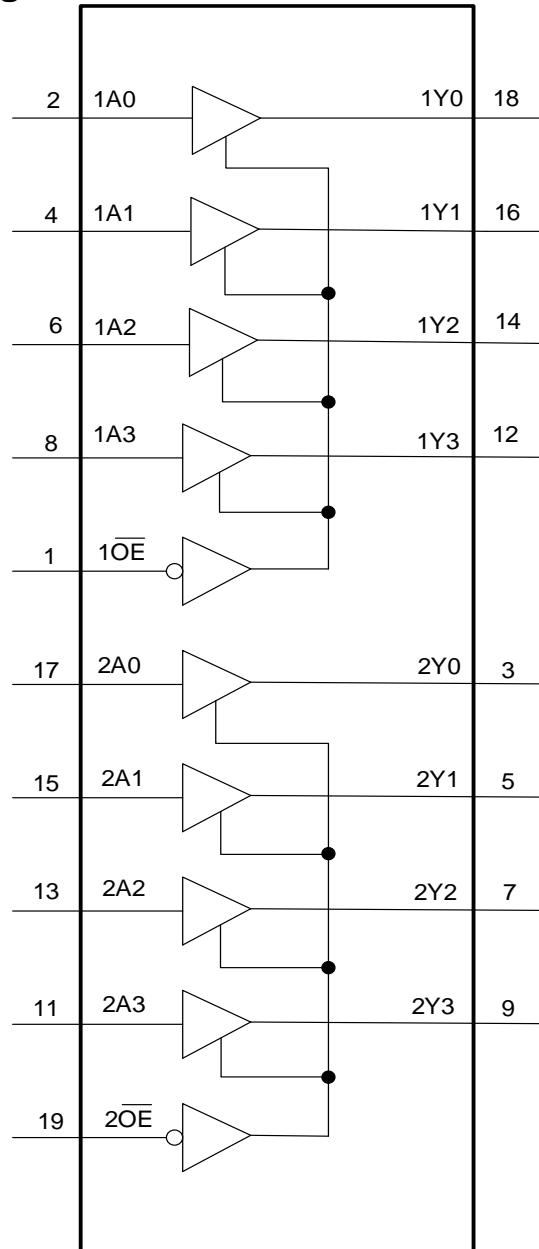

To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to V<sub>CC</sub> through a pullup resistor, the minimum value of the resistor is determined by the current-sinking capability of the driver.
