

**600mA Low Noise High PSRR  
LDO with Shutdown**

## Description

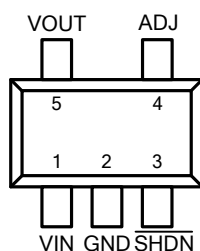

The FP6166 is a low dropout, low noise, high PSRR and very low quiescent current positive linear regulator. The FP6166 can supply 600mA output current with low dropout voltage at about 890mV that optimized for battery-powered systems or portable wireless devices such as mobile phones. The shutdown function can provide remote control for the external signal to decide the on/off state of FP6166 that consumes less than 0.1 $\mu$ A during shutdown mode.

The FP6166 regulator is able to operate with output capacitors as small as 1 $\mu$ F for stability. Other than the current limit protection, FP6166 also offers the on chip thermal shutdown feature providing protection against overload or any condition when the ambient temperature exceeds the maximum junction temperature.

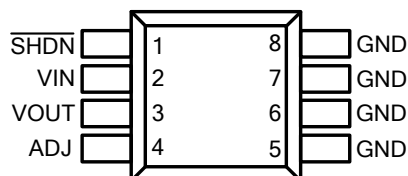

The FP6166 offers high precision output voltage of  $\pm 2\%$ . It is housed in low-profile, space-saving SOT-23-5 and SOP-8 packages.

## Pin Assignments

### S5 Package (SOT-23-5)

### SO Package (SOP-8)

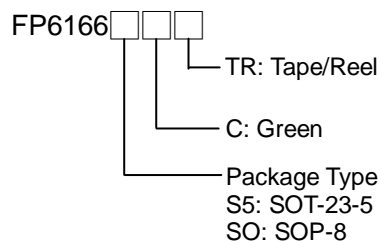

## Features

- Low Dropout Voltage of 890mV at 600mA
- Low 30 $\mu$ Vrms Output Noise
- Guaranteed 600mA Output Current
- Adjustable Mode Output Voltage Range is from 1V to 5.5V- $V_{drop}$
- High Power Supply Rejection Ratio of 70dB at 10kHz
- Very Low Quiescent Current at 45 $\mu$ A
- Max.  $\pm 2\%$  Output Voltage Accuracy
- Fast Response in Line/Load Transient
- Thermal Shutdown Protection
- Current Limit Protection
- Low-ESR Ceramic Capacitor for Output Stability
- Miniature Packages: SOT-23-5 and SOP-8
- RoHS Compliant

## Applications

- Mobile Phone
- Notebook, Sub-Notebook and Tablet Computer
- DSC
- Portable Information Appliance
- Battery Power System

## Ordering Information

### SOT-23-5 Marking

| Part Number | Product Code |
|-------------|--------------|
| FP6166S5CTR | C7G          |

Figure 1. Pin Assignment of FP6166

## Typical Application Circuit

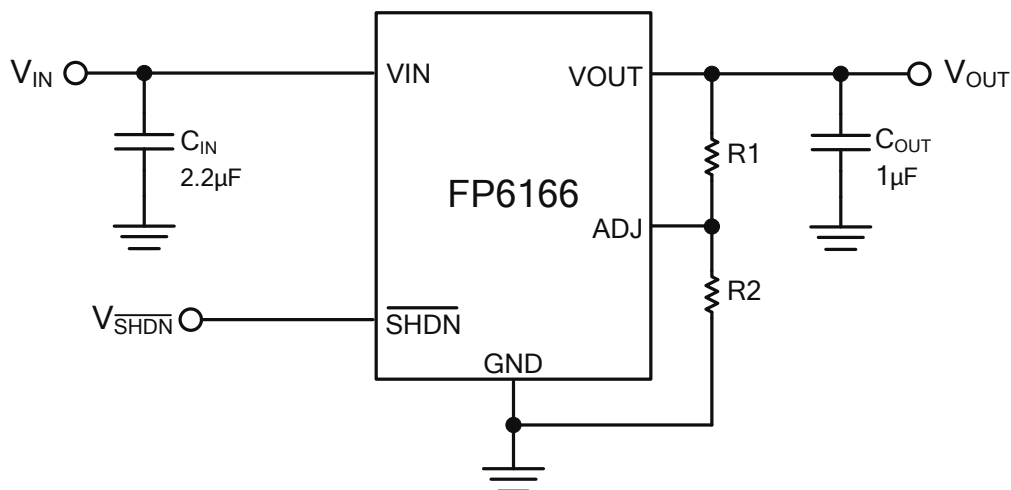

Figure 2. Typical Application Circuit of FP6166

Note 1 : To prevent oscillation, it is recommended to use minimum 2.2μF/1μF X7R or X5R dielectric capacitors if ceramics are used as input/output capacitors.

## Functional Pin Description

| Pin Name    | Pin Function  |
|-------------|---|
| <b>VIN</b>  | Power is supplied to this device from this pin which is required an input filter capacitor. In general, the input capacitor in the range of 2.2μF to 10μF is sufficient.  |
| <b>VOUT</b> | The output supplies power to loads. The output capacitor is required to prevent output voltage from oscillation. The FP6166 is stable with a 1μF or greater output capacitor. The larger output capacitor will be required for application with larger load transients. The large output capacitor could reduce output noise, improve stability and PSRR. |
| <b>ADJ</b>  | Voltage Feedback Input Pin. Connect ADJ and VOUT with a resistive voltage divider.  |
| <b>GND</b>  | Common Ground Pin   |
| <b>SHDN</b> | Pull this pin high to enable IC, and pull this pin low to shutdown IC. Keeping this pin floating will shut down IC due to the built-in pull-low resistor.   |

## Absolute Maximum Ratings

- $V_{IN}$ ,  $\overline{SHDN}$ , ADJ to GND ..... +6V
- Package Thermal Resistance ( $\theta_{JA}$ )
  - SOT-23-5 ..... +250°C/W
  - SOP-8 ..... +110°C/W
- Maximum Junction Temperature ( $T_J$ ) ..... +150°C
- Storage Temperature Range ( $T_{STG}$ ) ..... -65°C to +150°C
- Lead Temperature (Soldering, 10 sec.) ( $T_{LEAD}$ ) ..... +260°C

Note 2 : Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device.

## Recommended Operating Conditions

- Input Voltage ( $V_{IN}$ ) ..... +2.0V to +5.5V
- Operating Temperature Range ( $T_{OPR}$ ) ..... -40°C to +85°C

## Electrical Characteristics

( $V_{IN}=V_{OUT}+1V$ ,  $\overline{SHDN}$  pin connected to  $V_{IN}$ ,  $C_{IN}=2.2\mu F$ ,  $C_{OUT}=1\mu F$ ,  $T_A=25^\circ C$ , unless otherwise specified)

## Application Information

The FP6166 is a low dropout linear regulator which provides 600mA output current at dropout voltage about 890mV. Current limit and on chip thermal shutdown features provide protection against any combination of overload or ambient temperature which exceeds maximum junction temperature.

### Output Voltage Setting

The output can be set to fixed or adjustable mode. The internal output mode comparator compares the ADJ pin voltage with 166mV reference. If the ADJ pin voltage is higher than 166mV, the FP6166 will be set into adjustable output mode and the non-inverting input of the error amplifier will be connected to the external voltage divider. If the ADJ pin voltage is lower than 166mV, the FP6166 will be set into fixed output mode and the non-inverting input of the error amplifier will be connected to the internal voltage divider.

The output voltage  $V_{OUT}$  is set by using a resistive divider R1 and R2. Thus the output voltage is:

$$V_{OUT} = 1V \times \left(1 + \frac{R1}{R2}\right)$$

### Output and Input Capacitor

The FP6166 regulator is designed to stabilize with a wide range of output capacitors. The ESR of the output capacitor affects stability. Larger value of the output capacitor decreases the peak deviations and improves transient response for larger current changes.

The capacitor types (aluminum, ceramic and tantalum) have different characterizations such as temperature and voltage coefficients. All ceramic capacitors are manufactured with a variety of dielectrics, each with different behavior across temperature and applications. Common dielectrics used are X5R, X7R and Y5V. It is recommended to use 1μF to 10μF X5R or X7R dielectric ceramic capacitors with 30mΩ to 50mΩ ESR range between device outputs and ground for stability. The FP6166 is designed to stabilize with low ESR ceramic capacitors, and higher values of capacitors and ESR could improve output stability. The ESR of output capacitor is very important because it generates a zero to provide phase lead for loop stability.

There is no requirement for the ESR on the input capacitor, but its voltage and temperature coefficient have to be considered for device application environment.

### Protection Features

In order to prevent overloading or thermal condition damaging the device, FP6166 contains internal thermal and current limit functions which are designed to protect the device. It will rapidly shut off PMOS pass element during over-temperature condition.

### Thermal Consideration

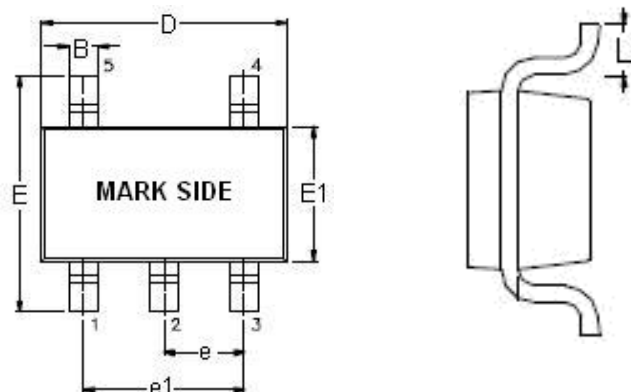

The power handling capability of the device will be limited by allowable operation junction temperature (125°C). The power dissipated by the device will be estimated by  $P_D = I_{OUT} \times (V_{IN} - V_{OUT})$ . The power dissipation should be lower than the maximum power dissipation listed in "Absolute Maximum Ratings" section.

### Shutdown Operation

The FP6166 will be shut down by pulling the  $\overline{SHDN}$  input low and turned on by driving the  $\overline{SHDN}$  high. If  $\overline{SHDN}$  pin is floating, the FP6166 will shut down because  $\overline{SHDN}$  pin has built-in a pull low resistor (refer to Block Diagram).
